

LIPSTICK illuminated bollard, 60 cm high, made of anodized aluminum or stainless steel and polycarbonate.

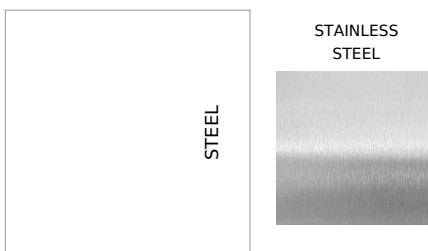

The O031.00 model has RGB diodes backlight with the possibility of programming the lighting mode or connecting to a central management system and a modular anchoring system with IP67 class and electrical connection.

The LIPSTICK series posts not only separate the zones from each other, but are also an intelligent lighting element. The bollard management system allows you to configure the lighting schedule as well as detect events such as vehicle movement in the zone. Thanks to this, the posts significantly affect the safety of pedestrians.

**Dimensions and materials available below.**
